How to Use

Purpose

An independent check that the developer's change package is complete and the test evidence proves the change works without breaking anything else. This is not a code review or a re-test: the reviewer checks the ticket, map standards, scenarios, output and the regression comparison.

When

Starts The developer has completed EDI-TPL-01 and attached the results to the change ticket.

Ends Review Result on the Overview tab is Approved and both sign-off dates are filled in. Then proceed to EDI-TPL-03 Deployment Checklist.

Who An EDI developer other than the author, with working knowledge of the translator and the EDI message type being changed.

Steps

1. Complete the Overview tab. Missing ticket details are themselves grounds for Rework Required.
2. Set each check's Status to PASS, FAIL or N/A on the Peer Review Checklist tab, using the Criteria column as your guide.
3. For each FAIL, write the finding in Findings / Notes, prefixed [CRIT] or [MINOR] (see Severity below).
4. When the developer fixes a finding, recheck it, change Status to PASS and keep the history, e.g. "[CRIT] Initially FAIL: N1*ST missing. Fixed in v1.4. Rechecked 2026-10-06."
5. Check Checklist Status on the Overview tab. Set Review Result to Approved only when it reads "All checks PASS / N/A" and no [CRIT] finding is open; otherwise set Rework Required.

Notes

- Use N/A only for checks that do not apply, and give the reason in Findings / Notes. Example: for a brand-new map there is no production version, so regression (PR-14 to PR-18) is N/A. PR-04 still applies: record Rollback Version as "None – new map" and mark it PASS.
- Checklist Status updates automatically. A Review Result of Approved turns red if any check is FAIL or unanswered. Peer Reviewer turns red if it matches the Developer.
- Map naming and version standards (PR-06, PR-07) refer to your team's documented conventions. Link or name the standard in Findings / Notes if it is not obvious.

Severity

Critical Wrong or missing data to the partner, a failed or unexplained regression difference, a broken naming or version standard that affects deployment or rollback, or missing test evidence. Must be fixed and closed before approval.

Minor Ticket wording, labelling or evidence formatting with no data impact. Close it, or record a follow-up CR ID in Findings / Notes.

Why regression matters most

Most production incidents after a map change come from fields nobody intended to touch. Running the same input files through the production version and the new version, then diffing the outputs, is the most reliable way to catch them. If the map is shared by several trading partners, every affected partner needs coverage.

Overview	
Change / Ticket ID	CHG20260417
Change Description	Add the Ship-To party (N1*ST loop with N3/N4 address) to outbound 810 invoices for Harbor Fresh Markets, sourced from the store number on the original 850. Business reason: partner compliance chargebacks for invoices without a ship-to.
Trading Partner(s)	Harbor Fresh Markets (HFM)
EDI Standard - Version / Release	X12 - 004010
Message Type - Direction	810 - Outbound
Map Name	HFM_810_4010_OB
New Map Version	v1.4
Rollback Version *(current production)*	v1.3
Test Results *(EDI-TPL-01 filename)*	EDI-TPL-01_Test-Scenarios-and-Results_CHG20260417-HFM_810_4010_OB.xlsx
Developer	C. Lorenzo
Developer Sign-off Date	2026-10-05
Peer Reviewer	B. Santos
Reviewer Sign-off Date	2026-10-06
Checklist Status *(automatic)*	**All checks PASS / N/A**
Review Result *(Approved / Rework Required)*	**Approved**

Peer Review Checklist				
ID	**Items to Check**	**Criteria**	**Status**	**Findings / Notes**
A. Change Ticket Completion				
PR-01	Change ticket has the CR ID, description of the change, and business reason.	Ticket fields filled in, not "see email".	**PASS**	CR ID, description and business reason (compliance chargebacks) all present on the ticket.
PR-02	Trading partner, EDI message type, direction and map name are recorded and match the map.	Compare the ticket against the map name and version in the translator. Map logic review is out of scope.	**PASS**	HFM / 810 / Outbound / map name on the ticket match the map and partner profile in the translator.
PR-03	Expected result / acceptance criteria are stated.	A reviewer can tell what "correct" looks like without asking the developer.	**PASS**	[MINOR] Acceptance criteria do not say what happens when the store has no address line 2. Covered by TS-04; ticket wording to be updated under follow-up CR-2026-0431.
PR-04	New map version, rollback version and any dependent objects (code lists, business processes, envelopes) are recorded.	Rollback version is the one currently in production. For a new map, record "None – new map" and mark PASS.	**PASS**	New v1.4, rollback v1.3. Dependent object: code list CL_HFM_STORE_XREF v2.1, unchanged by this CR.
PR-05	Test results (EDI-TPL-01) and output files are attached to the ticket.	Input files, output files and the results sheet are all present. Each output file is named or labelled with its scenario ID.	**PASS**	Inputs, outputs and results sheet attached. Output files named by scenario ID (TS-01 to TS-05).
B. Map Standards				
PR-06	Map name follows the standard naming convention.	Check the map name against the team naming standard. No temporary or personal suffixes (e.g., _test, _new, _final).	**PASS**	Matches the Team Map Naming Standard.
PR-07	Map / component version has been updated according to team standards.	New version is incremented from the rollback version and matches the version on the ticket and the Overview tab. For a new map, the initial version follows the team standard.	**PASS**	v1.3 → v1.4. Same version on the ticket, translator and Overview tab.

ID	Items to Check	Criteria	Status	Findings / Notes
C. Test Scenarios				
PR-08	Every change in the ticket has at least one test scenario.	Map each requested change to a scenario ID in EDI-TPL-01.	**PASS**	N1*ST loop → TS-01, TS-02. N3/N4 address → TS-03.
PR-09	Scenarios cover alternate or conditional paths, and at least one negative or edge case, where the change allows it.	One scenario per qualifier or code value the change branches on, plus edge cases such as a missing optional segment, invalid code or maximum repeats.	**PASS**	Single-store and multi-store orders covered (TS-01, TS-02). TS-04: address line 2 blank, N302 omitted. TS-05: store number missing, map raises error and invoice is held.
PR-10	Test input files are realistic, production-like samples with fictional or masked data.	Not hand-typed minimal files only; no real PHI or PII.	**PASS**	Built from masked production orders; store names and addresses replaced with fictional values.
PR-11	All scenarios were run and each has a recorded PASS result.	No blank results. Each scenario in EDI-TPL-01 shows both expected and actual results. Any scenario FAIL that was not fixed and rerun means PR-11 is FAIL; record it in Findings / Notes.	**PASS**	TS-01 to TS-05 all PASS, expected and actual results recorded. TS-02 failed on first run; fixed and rerun (see PR-12).
D. Output Verification				
PR-12	Output for the changed fields matches the expected result in EDI-TPL-01.	Open the output file; check the changed segments and elements yourself.	**PASS**	[CRIT] Initially FAIL: N1*ST missing on TS-02 (multi-store order). Fixed in v1.4. Rechecked 2026-10-06.
PR-13	Output is valid for its direction: compliant EDI for outbound, a clean load for inbound.	Outbound: no compliance errors; enveloping segment counts and control numbers match; test/production indicator set to production. Inbound: output loads to the target format without errors; functional acknowledgment (997/999 or CONTRL) generated as expected, where in scope.	**PASS**	No compliance errors. SE01, GE01, IEA01 and CTT01 correct; control number pairs match. ISA15 = T in test output; production envelope profile set to P (checked).

ID	Items to Check	Criteria	Status	Findings / Notes
E. Regression				
PR-14	The same input files were run through the production version and the new version.	Same files, both versions. A regression run on the new version alone is not regression.	**PASS**	12 masked production files from September 2026 run through v1.3 and v1.4.
PR-15	Outputs were compared and only the intended changes differ.	Review the diff. Every difference traces to the change ticket.	**PASS**	Diff shows N1*ST/N3/N4 added on all 12 invoices and SE01 up by 3 to match. No other differences.
PR-16	If the map is shared across trading partners, regression covers each affected partner.	At least one sample file per partner using the map, run through both versions.	**N/A**	Map is used by HFM only (checked the where-used list in the translator).
PR-17	Comparison evidence (diff report or screenshot) is attached to the ticket.	Evidence shows file names and both map versions.	**PASS**	[MINOR] Initially FAIL: diff screenshot did not show map versions. Developer attached the diff report with v1.3 and v1.4 in the file names. Rechecked 2026-10-06.
PR-18	Any unexplained difference is resolved or logged as a finding.	Unexplained differences block approval.	**PASS**	No unexplained differences.
